Legal disclaimer

General information only. Not an offer to sell or solicitation to buy securities, virtual assets, or any investment product. Not investment, tax, or legal advice. Forward-looking statements are subject to risk; protocol economics and token features may change or never launch. Terms of any transaction are governed only by signed documents.

一般性信息；不构成在任何司法辖区出售或要约购买证券、虚拟资产或投资产品的要约或诱引，亦不构成投资、税务或法律建议。前瞻性表述受风险影响；协议参数与代币安排可能变更或不再推出。交易条款仅以双方签署文本为准。

IC one-pager takeaways (~8–10 lines · not legal advice)

Market (one line): Cross-border and destination fulfillment still pay a trust-and-settlement tax—coverage, clearing, and disclosure-reconciliation costs stay on operators and channels.

Protocol rails (one line): Traveler **principal** sits in on-chain **Escrow**; **allocatable order fees** that reach the router, treasuries, and governance (including **TTG**, if any) stay on **separate rails**—see **06 §06–§07** for the published boundary narrative.

Stage & dependencies (one line): The **core path is demonstrable**; whether the product is fully open to the public and under which domains follows **published announcements and environment labels**; operating metrics ship **after NDA** with **traceable exports** aligned by IR/Finance.

Three diligence self-checks (tick in meeting; still not legal advice)

1. **On-chain vs off-chain:** what is verifiable on-chain? how do disputes/reputation surfaces map to on-chain facts? (**06 §05, §10**)
 2. **Fee denominators:** is the **45/55** first layer ever verbally merged with **gas / arbitration / slashing** “pies” ? (**06 §06**)
 3. **Value without TTG:** if a governance token is **never issued**, what capture axes remain discussable? (**06 §06, §10.2**)
-

Problem

Cross-border bookings with local guides suffer from **trust and settlement friction**: pay-first vs deliver-first; traditional platform accounts and take rates add coverage and clearing cost.

What we are

TravelTrust (protocol brand **TrustLayer**) is a **decentralized custody and trust protocol** for travel: order funds are locked and released in on-chain **Escrow** under transparent rules;

coordination, evidence, ratings, and retrieval are mainly off-chain. Design principle: **on-chain fund truth + auditable rules**, not a single centralized ledger for all commerce.

Core capabilities

- **Secured payment:** travelers place stable, allowlisted assets into escrow; funds release or refund after completion or dispute resolution.
- **Guide onboarding & performance:** credentials and **performance-style staking** tracks; **decoupled** from governance token design where appropriate.
- **Marketplace & fulfillment loop:** matching, order state, disputes/arbitration linked to escrow state.
- **Governance roadmap:** fee routing, treasuries, DAO, and a governance token (TTG) stay **separate from per-order escrow principal**.

Differentiation

1. **Custody vs governance separation:** user principal in Escrow; fees, treasuries, governance on distinct paths.
2. **Settlement vs TTG:** orders quote and settle in **allowlisted stable assets**; **no** platform payment token in the current phase.
3. **Multi-region:** room to evolve regional pools subject to law and product finalization; **no** fixed yield, principal protection, or corporate equity return promises.

Timing vs “wait a year” (qualitative)

Not a subscription urgency pitch or performance promise. Funds often ask why diligence should not wait. Public framing: (1) **fragmented distribution** pulls **embeddable**

custody/dispute into B2B integration and disclosure-reconciliation agendas—delay does not reverse direction, only **who ships auditable templates first**. (2) **Consumer protection and fund-path disclosure** expectations do not soften by waiting—early **principal vs fee** language helps pilot conversations (**not** legal advice). (3) **Maturing rails** move competition from “can it demo?” to **scalable pilots**—gaps are execution and disclosure readiness; see in-pack 06 Whitepaper PDF **§2.4, §10.2, §11**.

Under NDA, diligence checks “types” , not undisclosed numeric promises: over the next execution windows, funds can verify **pilots respect published disclosure boundaries, custody/order UX keeps converging**, and **whether B2B embed pilot terms (LOI-style) exist to sign—not** hidden revenue or on-chain volume wagers.

Fees (high level)

Allocatable order fees that reach the fee router may split between **national/regional buckets** and a **global pool**, with further splits for incentives, reserve, and operations (ratios in finalized economic annexes). **On-chain gas, arbitration fees, and guide performance slashing** use **different denominators**—do not merge into one pie chart without footnotes.

Stage

Continuous engineering; some economics roll out in phases. Do not claim full mainnet completion for all modules without independent verification and formal disclosure.

Risks (summary)

Smart contracts, regulatory classification, roadmap change (**including no token issuance**), and market volatility may cause loss. Use materials only where legally appropriate after required approvals.
